

CVCS System

CVCS System (Workplace accident case management system) is a software package for the management of the identification of the causes of workplace accidents.

The software allows for the creation of case files, the management of associated data, and the delivery to the audit Committee for the subsequent examination of the case.

The speed of the process, the simplification of bureaucracy, the log of results and actions, and the storing and recovery of documents are some of the challenges that ALGORITMI has addressed to respond to the need to improve process and organisational capabilities.

Workplace accident case management system

Principal functions

Respect the guidelines in regards to document flow management within public administration

Automatic handling of case files and identification of the causes of accidents or incidents suffered by employees

Maintain a centralised database containing information relative to the cases

Automate the production of Reports, Decrees and Communications in Word format

Manage the procedures following the issue of a determination on the part of the Committee

Produce Decrees with Notifications and Compensation

Points of force

Eliminating the physical transport of cases and their annexes

Accelerating and simplifying the preparation of Reports, Decrees and Communications

Lighten the Committee's workload

Decentralise the information towards peripheral administration

Drastically reduce the time taken to reply to employees' claims

Reduce backlog
