

GSPP

The GSPP system (Production Specifications Management System) manages all of the phases of a productive process.

The phases of the productive process managed by the application are the management of primary materials and their elaboration within formulas.

The products managed by the system can be: prepared products or the results of the productive process generated by formulas.

GSPP can be integrated with external systems (Web Services), has an email notification manager and uses a DBMS. GSPP allows the production of personalised production reports. The reports have the advantage of being consultable according to the rights assigned during the profiling phase.

Production Specifications Management System

Principal functions

Creation and modification of Primary Materials and Formulas through Web modules

Product Management

Management of approval processes

Secrecy management for sensitive data

Sending communications to the Project Team regarding the approval process steps

Report Management

Secondary functions

Management of anagraphic data via Web

User profile management via Web

Historical log of the entire productive process

Dedicated archives

Archive research module

Exporting of search results in Excel and Pdf format

Personalisation

Mobile mode
Interaction with applications that support the productive process
Personalised configuration of the approval work flow and email notifications
Graphic layout
Predisposition of report templates
Configuration of the sensitive data subset

Points of force

Control of productive process and approval procedures
Segregation of sensitive data
Configurable Reports
Personalised data export from web interface
This assures
That the productive process responds to the standard quality requirements
Log file of decisions made during approval processes
Working in transparency and a process managed by diverse user profiles
